1998 Nebraska Farm Custom Rates - Part II

H. Douglas Jose, Extension Farm Specialist
William Miller, Extension Economist
Lance Brown, Student Assistant

Every two years a survey of custom operations is conducted to determine the current rates charged for specific machinery operations. The survey is divided into two parts: spring and summer operations, including planting and small grains harvest in Part I and information about fall and miscellaneous operations in Part II.

The responses are reported by the Agricultural Statistics Districts shown on the map below. Custom rates reported include charges for the use of necessary equipment, fuel and supplies such as baling wire or twine provided by the custom operator, and labor. Seed, fertilizer and chemical costs are not included unless so indicated.

This survey is not based on a random sample of custom operators in Nebraska. Questionnaires were sent to all the names on our custom operators mailing list. Thus, the results reflect the average of those responding to specific questions and may not be representative of the rates charged in a particular area. The **Average Rate** should provide an accurate estimate of the prevailing charge for a specific operation, particularly if there are a large number of responses. The **Most Common Rate** is the rate reported more often than any other for that practice. The **Range** gives the minimum and maximum amounts reported.

The rates do not necessarily measure the full economic cost of performing the work specified or the break even cost for a custom operator. Some custom operators may only charge for the operating costs of fuel and labor. Other operators may charge for all costs including depreciation on equipment plus a charge for the risks of being able to do the

work in a timely manner. Field conditions, the amount of custom work done and the size of the machine used will account for some of the range in the rates charged. Situations which reduce the acres covered per hour such as, terrain, small fields, weedy conditions, lodged crops and odd row spacings may require a higher custom rate.

One source of estimated costs of owning and operating machines is the "Minnesota Farm Machinery Economics Cost Estimates for 1998." It is available electronically at: <http://www.mes.umn.edu/Documents/D/C/DC6696.html>

The rates reported in Part II - Custom Rates were the prevailing rates in the summer of 1998. In determining the rates for 1999, custom operators and farm owners should consider changes in the costs of machinery, labor and fuel.

For example, assume the cost of a machinery operation is comprised as follows: Tractor ownership and repairs: 40 percent; Other machine, ownership and repairs: 15 percent; Fuel and lubrication: 25 percent; Labor: 20 percent. If the price of tractors increases by 5 percent from 1998 to 1999, the change for the custom operation would need to be increased by 2 percent ($.05 \times .4$) to continue to cover all operating costs.
